EXPERIENCE

Trillium Trading *(Proprietary Trading Firm)* **September 2024 – Present**
Forward Deployed Engineer, AI Operations *New York, NY*

- Head of AI for the firm, fully responsible for all AI projects and automations firm-wide across traders, engineering, executives, and accounting. Report to the engineering lead while owning AI strategy, prioritization, and delivery.
- Turn discretionary trading workflows into production systems by capturing how traders make decisions, encoding them into tools and rules, and owning the path from pilot to firm-wide use.
- Act as the front-facing engineer to traders. Gather requirements, direct AI coding agents to build, review generated code, and hand validated prototypes to engineering to productionize.
- Own end-to-end delivery of firm AI tools and automations. Design and pilot, ship to production (Entra SSO and nginx where applicable), run day-to-day AI Ops stand-ups with the engineering lead, and keep Confluence and Jira (AIO) current.

AI Request Intake *(Python, FastAPI, SQLite, Microsoft Entra ID SSO)*

- Full-stack web app that turns an informal request into a structured spec. Claude runs up to three rounds of multiple-choice follow-ups, writes an intake record and build brief, routes it through an approve/defer/reject queue, and opens a Jira issue on approval.
- Built in Python with FastAPI, server-rendered HTML, and SQLite, using Claude structured outputs with a cached system prompt. Secured with Entra ID SSO scoped to the firm tenant, signed sessions, and a reviewer allowlist. Deployed behind nginx HTTPS.

Daily Trading Information *(Python, Claude API, GitHub Actions CI)*

- Automates 17 recurring morning market-data reports newer traders previously assembled by hand, pulling from SEC EDGAR, newswires, and exchange calendars into HTML drafts before the trading day.
- Python CLI with a per-report fetch-and-render pipeline and a Claude API layer that tiers from Haiku to Sonnet, scheduled on a holiday-aware trading calendar through GitHub Actions, with 155 offline tests.

Trillium Support Agent *(Python, Claude API, BM25 retrieval)*

- Internal assistant that answers trader and staff questions from the firm knowledge base with citations, abstains when unsure, and escalates urgent issues (Teams / on-call).
- Python service with rule-based P1/P2/P3 triage ahead of the model, persona-scoped retrieval over a BM25-indexed knowledge base, structured-JSON answers with source citations from Claude, and a golden-set evaluation harness with 64 tests.

Trader

- Operated inside live trading systems on short-horizon U.S. equities. Monitored positions, inventory, and risk limits; adjusted size and exposure when the book drifted from plan.
- Traded single-name U.S. equities on a catalyst and event-driven book (earnings, M&A, index/rebalance, activist and short reports, biotech and newsflow), with rules-based exits and defined downside on each position.
- Mentored four junior traders on setups, risk rules, habit formation, and structured review so each could run a consistent process independently day to day.

AI Performance Coach *(Python, OpenAI API)*

- Turns daily self-reviews and per-trade records into an automated end-of-day read that surfaces recurring process patterns.
- Replaces a manual review loop with a structured deliberate-practice report so process breakdowns show up before the next session.

Market-News & Short-Report Feed *(Python, threading, BeautifulSoup, Cerebras)*

- Concurrent Python scraper polling dozens of news, short-report, AI-blog, and SEC-filing sources, one daemon thread per source, with per-site parsers, URL-based change detection, and clean shutdown via threading.Event.
- Streams new items to a live terminal feed, and a Cerebras LLM summarizes the newest one into a one-glance brief.

Notes Aggregator *(Python, Flask, Playwright, Cerebras)*

- Python pipeline that parses the firm's Trac PDF of heavily traded symbols with pdfplumber, filters to single-name equities, and drives TradeTheNews through Playwright to scrape each ticker's headlines.
- Scores each catalyst's materiality with a Cerebras LLM inside a position-time window, then merges approved notes into a 6,700-entry XML-style file behind a Flask review UI. Cuts roughly two hours of manual note-taking a day.

EDUCATION

Duke University **May 2024**
Bachelor of Science in Computer Science *Durham, NC*

- **Awards:** Air Force ROTC Type 1 Scholarship and Academic and Physical Excellence Awards; Dean's List with Distinction.
- **Extracurriculars:** Duke Sports Analytics Club, Duke FinTech Club, and Duke Men's Varsity Cheer (Founding Member).

MATH 585, Introduction to Algorithmic Trading (Final Project)

- With a 4-person team, built a Bitcoin/Ethereum trading strategy on QuantConnect using a Random Forest that predicts 15-day returns from technical, macro, and news-sentiment features, shipped in Python with unit tests, linting, and CI/CD. Placed 2nd in Duke's FinTech Trading Competition, ranked by Sharpe ratio.
- Owned the position-sizing layer. Built a piecewise "importance" function that maps predicted-return magnitude to a confidence weight, blended it with a modified Kelly criterion, and added a Google Trends alternative-data signal (pytrends).

ADDITIONAL INFORMATION

- **Skills:** Python, Java, C, SQL, Linux, Web Scraping, LLM APIs, Git, CI/CD, Excel, VBA, L2 Order Book and Tape Reading, and Bloomberg.
- **Certifications:** Akuna Capital Options 101/201, Algorithmic Trading (QuantConnect), and AZ-900 Azure Fundamentals.
- **Interests:** DJing and Electronic Music Mixing, Live Events, Financial Markets, Beli, Sportsbook Arbitrage, and Social Golf.
